Will It Fit?

Introduction to railroad clearances

Can You Spot the Clearance Problems?

Clearances

AREMA C-28 MODULE 12

- Safety Mandates
- Side Clearances
- Overhead Clearance (* NS Bridge Collision clip with stack train in siding)
- Track Clearances
- Overhead Wires (NEC Code)
- Doorways, Openings, Bridges

www.f-w.com

• • • •

Turnouts & Switches (AREMA C-5)

MODULE 3

- Frog Unit Triangle
- Terminology
- Layout Terminology
- Layout Methodology
 - Semi Tangent Method
 - Equivalent Curve Method
 - Significance of long tie / switch ties on grade & alignment

Switch Components / Familiarizations

No field trip for ISPLS

Track & Switch Geometry

- Headblock, Point of Switch HB/Pt Sw
- Point of Frog (PF) =PT-TO
- Turnout Lead
- Size of Turnout (Unit Triangle = Frog #)
- Equivalent Curve vs Switch & Lead Curves
- Rail Size
- Crossing Frogs / DIAMOND\$

Switch Components

Turnout Standard Plans

www.f-w.com

• • • • •

Basic Turnout Geometry

- Simple curves, chord definition (not arc; what's radius good for?)
- The typical boundary surveyor need only be concerned with HB (PtSw), PF, measured lead, frog angle, frog size & description, degree of equivalent curve, switch point length and weight of rail. (This is what you need to communicate to the railroad with!)
- If elevation is important, please note end of long switch ties! (Defines plane)

Theoretical PF = PT-TO

(Offset radially 1/2 gauge)

Point of Switch [PTSW] = Headblock [HB]

Basic Turnout Geometry

- Simple curves, Chord Definition (not arc; what's radius good for?)
- The typical boundary need only be concerned with HB (PtSw), PF, measured lead, frog angle, frog size & description, degree of equivalent curve, switch point length and weight of rail. (This is what you need to communicate to the railroad with!)
- If elevation is important, please note end of long switch ties!

When Looking at This...

... Think Like This!

Turnout Layout: Construction Step "A"

- Pick your tangent baseline to come out of (must match rail)
- Set your PI
- Turn your frog angle delta, using semi-tangent "T" from your standard plans or switch table, establish your PT TO (Theo. PF)
- Set your PC on the baseline using your semi-tangent distance "T"

Turnout Layout: Construction Step "B"

- Lay in your equivalent curve radius ("r") between the *PC* and *PT*
 - *i.e.* "Fillet the Curve"
- Equivalent radius is determined by solving for "r". Using either given semi-tangent distance, lead distance or degree of equivalent curve "D"
 - *** beyond the PT a short piece of tangent [20-45 long depending on frog length, PF to HEEL] because actual component is tangent (fixed) as fabricated in the rail mill .

Try to avoid curves between the PF and the end of the largest (17 ft?) Ties...

Turnout Layout: Construction Step "C"

- Lay-in your point of switch/ headblock (PTSW=HB)
- Switch symbol is a 6 ft segment (switch rod) topped off by a 2 ft diameter circle (outline of old base of switch stand [thus the lollipop symbol])

Turnout Layout: Construction Step "D"

• Remove the short segment of curve between the PC and PTSW

arnsworth

 HB or PTSW is used to label the beginning of a track in a turnout in order to avoid confusion with the Pointof-Spiral (PS) in a spiral curve (i.e. <u>PS</u>--PSC--PCS--ST)

Turnout Layout: Construction Step "E"

- Lay out the limits of your long switch ties (8 ft to 17 ft in stepped increments generally as determined by your standard plan for a given turnout
 - ** Switch tie limits (blue dotted line) denotes where both tracks must remain in the same plane and hold the same grade....
